Atomic structure

$\left.\begin{array}{l}\odot \\ \text { electron } \\ \oplus \\ \hline\end{array}\right)$ neuton

Protons and neutrons (nucleons) are located in the nucleus of the atom.

## Electrons are located in energy

 levels surrounding the nucleus.| Sub-atomic <br> particle | Relative <br> charge | Relative <br> mass |
| :---: | :---: | :---: |
| proton | +1 | 1 |
| neutron | no charge | 1 |
| electron | -1 | $1 / 2000$ |

Principal energy levels $(n)$ in an atom

Electrons are located in principal energy levels (main energy levels). The first main energy level ( $n=1$ ) has the lowest energy and energy increases as the value of $n$ increases. Each main energy level can hold a maximum of $2 \mathrm{n}^{2}$ electrons.
$n=2\left(2 \times 2^{2}\right)=8$ electrons
$n=3\left(2 \times 3^{2}\right)=18$ electrons

Each main energy level is split into sub-levels. $n=1$ has 1 sub-level (1s)
$n=2$ has 2 sub-levels ( $2 \mathrm{~s}, 2 \mathrm{p}$ )
$n=3$ has 3 sub-levels ( $3 \mathrm{~s}, 3 \mathrm{p}, 3 \mathrm{~d}$ )
$n=4$ has 4 sub-levels ( $4 \mathrm{~s}, 4 \mathrm{p}, 4 \mathrm{~d}, 4 \mathrm{f}$ )

Within a main energy level, the order of energy is:

$$
s<p<d<f
$$

Sub-levels th the ation

| Principal <br> energy level $(n)$ | Sub-levels | Number of electrons <br> in sub-level | Number of electrons <br> in main energy level |
| :---: | :---: | :---: | :---: |
| 1 | 1 s | 2 | 2 |
| 2 | 2 s | 2 | 8 |
|  | 2 p | 6 |  |
|  | 3 s | 2 | 18 |
| 3 | 3 p | 6 |  |
|  | 3 d | 10 |  |
|  | 4 s | 2 | 32 |
|  | 4 p | 6 |  |
|  | 4 d | 10 |  |
|  | 4 f | 14 |  |

| Main energy <br> level, $\boldsymbol{n}$ | Sub-levels | Number of <br> orbitals | Number of <br> electrons |
| :---: | :---: | :---: | :---: |
| 1 | 1s | 1 | 2 |
| 2 | $2 s, 2 p$ | 4 | 8 |
| 3 | $3 s, 3 p, 3 d$ | 9 | 18 |
| 4 | $4 s, 4 p, 4 d, 4 f$ | 16 | 32 |

$$
\begin{gathered}
\text { Atomujg numuber anud } \\
\text { mase number }
\end{gathered}
$$ The atomic number $(Z)$ is the number of protons in the nucleus of an atom.

The mass number $(A)$ is the total number of protons and neutrons (nucleons) in the nucleus of an atom.

| Atomic number |
| :---: |
| Element |
| Relative atomic |
| mass |

## $X$ is the symbol of the element $A$ is the mass number $Z$ is the atomic number

## 12 <br> 

## ${ }_{20}^{40} \mathrm{Ca}^{2+}$

20 protons
20 neutrons
18 electrons
35 protons
46 neutrons
36 electrons

## Which is correct for ${ }_{15}^{31} \mathrm{P}^{3-}$ ?

|  | Protons | Neutrons | Electrons |
| :---: | :---: | :---: | :---: |
| A | 15 | 16 | 15 |
| B | 16 | 15 | 18 |
| C | 15 | 16 | 18 |
| D | 15 | 16 | 12 |

## HJSJ Oheria Tritortals tor aB ehemiscy

Isotopes

Isotopes are atoms that have the same atomic number but a different mass number (they have the same number of protons but a different number of neutrons).

## 12 1 3 C ${ }_{6}^{14} \mathrm{C}$

6 protons
6 neutrons
6 electrons

6 protons
7 neutrons
6 electrons

6 protons
8 neutrons
6 electrons

## ${ }_{1}^{1} \mathrm{H}$

## 1 proton

1 neutron
1 electron

1 proton
2 neutrons
1 electron

The relative abundance of an isotope is the percentage of atoms with a specific mass number in a naturally occurring sample of the element.

| Isotope | Relative abundance (\%) |
| :---: | :---: |
| ${ }_{12}^{24} \mathbf{M g}$ | 78.99 |
| ${ }^{25} \mathbf{M g}$ | 10.00 |
| ${ }_{12}^{26} \mathbf{M g}$ | 11.01 |

| Isotope | Boiling <br> point $(\mathrm{K})$ | Melting <br> point $(\mathrm{K})$ | Density <br> $\left(\mathrm{g} \mathrm{cm}^{-3}\right)$ |
| :---: | :---: | :---: | :---: |
| ${ }_{1}^{1} \mathrm{H}$ | 20.4 | 14.0 | 0.09 |
| ${ }_{1}^{2} \mathrm{H}$ | 23.7 | 18.7 | 0.18 |
| ${ }_{1}^{3} \mathrm{H}$ | 25.0 | 20.6 | 0.27 |
| ${ }_{1}^{3} \mathrm{H}$ |  |  |  |

Chemical properties are related to the number of electrons in an atom - isotopes have the same number of electrons, therefore they have identical chemical properties. Isotopes have different numbers of neutrons, therefore their masses are different.
Isotopes have different physical properties such as density and boiling point.
To summarise, isotopes have identical chemical properties but different physical properties.

## Mass spectrum of lead (Pb)

| Isotope | Relative <br> abundance (\%) |
| :---: | :---: |
| ${ }^{204} \mathrm{~Pb}$ | 2.00 |
| ${ }^{206} \mathrm{~Pb}$ | 24.00 |
| ${ }^{207} \mathrm{~Pb}$ | 22.00 |
| ${ }^{208} \mathrm{~Pb}$ | 52.00 |

| Isotope | Relative abundance (\%) |
| :---: | :---: |
| ${ }^{204} \mathrm{~Pb}$ | 2.00 |
| ${ }^{206} \mathrm{~Pb}$ | 24.00 |
| ${ }^{207} \mathrm{~Pb}$ | 22.00 |
| ${ }^{208} \mathrm{~Pb}$ | 52.00 |

$$
A_{\mathrm{r}}=\frac{(204 \times 2.00)+(206 \times 24.00)+(207 \times 22.00)+(208 \times 52.00)}{100}=207.20
$$

## Isotope $\quad$ Relative abundance (\%)

$$
\begin{array}{|c|c|}
\hline{ }^{54} \mathrm{Fe} & 5.95 \\
\hline{ }^{56} \mathrm{Fe} & 91.88 \\
\hline{ }^{57} \mathrm{Fe} & 2.17 \\
\hline
\end{array}
$$

$$
A_{\mathrm{r}}=\frac{(54 \times 5.95)+(56 \times 91.88)+(57 \times 2.17)}{100}=55.90
$$

Bromine ( $A_{r}=79.90$ ) has two isotopes, ${ }^{79} \mathrm{Br}$ and ${ }^{81} \mathrm{Br}$. Calculate the relative abundance of each isotope.

$$
\begin{gathered}
79.90=\frac{81(x)+79(100-x)}{100} \\
7990=81 x+7900-79 x \\
x=45{ }^{81} \mathrm{Br}=45 \%{ }^{79} \mathrm{Br}=55 \%
\end{gathered}
$$

Europium ( $A_{r}=151.96$ ) has two isotopes, ${ }^{151} \mathrm{Eu}$ and ${ }^{153} \mathrm{Eu}$.
Calculate the percentage abundance of each isotope.

$$
\begin{gathered}
151.96=\frac{153(x)+151(100-x)}{100} \\
15196=153 x+15100-151 x \\
x=48{ }^{153} \mathrm{Eu}=48 \%{ }^{151} \mathrm{Eu}=52 \%
\end{gathered}
$$
